

# SIEM Dashboard - Detección SSH Brute Force

---

## Project Overview

This cybersecurity project simulates brute-force attacks targeting SSH services and leverages Splunk to detect and visualize malicious activity in real time. Using Kali Linux as the attacker and Ubuntu as the victim environment, I employed Hydra to generate failed login attempts and configured Splunk Universal Forwarder and Splunk Enterprise to collect and analyze log data.

-**Duration:** 4 hours **Difficulty:** Entry Level **Platform:** Kali Linux, Ubuntu

### -Tools:

- Hydra
- Splunk Universal Forwarder
- Splunk Enterprise

### -Objective

1. Create a dashboard that detects and visualizes brute force attempts against SSH services in real time

### -Lab Environment

Kali Linux 2025.2-virtualbox-amd64

Docker

Network Interface: eth0 / wlan0

### -Prerequisites

Basic Python or Bash scripting

SSH Protocol Fundamentals

Splunk Components

Hydra Tool Basics

## SIEM Dashboard - Detección SSH Brute Force - Detailed Report

Analyst: Raiza Rosas Aguilar Date: 30-11-25 Duration: 20 minutes Total Logs: [110]

## Executive Summary

This project simulates SSH brute force attacks and configures Splunk to detect them automatically. I implement alerts based on thresholds for failed attempts and create visualizations that allow a SOC team to identify attack patterns. The result is a functional dashboard that displays attacking IPs, frequency of attempts, and attack timelines.

## Purpose of the Lab

-Demonstrate the ability to:

1. Configure monitoring systems (SIEM).
2. Simulate controlled attacks (red team thinking).
3. Create actionable visualizations for SOC
4. Understand Linux logs at a granular level

## -Methodology

Machine used: Kali Linux (attacker) + Docker ubuntu(simulated victim)

### \*connected SSH

```
ssh ...@192.168.100.x
```

### \*configure my splunk

```
ip addr show | grep "inet " | grep -v 127.0.0.1
```

```
$  
└─$ (kali㉿labroar)-[~]  
└─$ ip addr show | grep "inet " | grep -v 127.0.0.1  
    inet 192.168.100.1 brd 192.168.100.1 scope global dynamic noprefixroute eth0
```

### checked status my splunk

```
sudo /opt/splunk/bin/splunk start
```

```
The Splunk web interface is at http://...:8000
```

this found the http://--:8000

### checked if splunk listening

```
sudo netstat -tlnp | grep 9997
```

### created docker

```
docker --version Docker version 27.5.1+dfsg4, build .....
```

```
→ 94:~$ ssh -l localhost -p 2222
ssh: connect to host localhost port 2222: Connection refused
0494:~$
```

hostname@localhost

## Step 1

In the victim environment, I place this script.

```
sudo apt update
sudo apt install openssh-server -y
sudo systemctl start ssh
sudo systemctl enable ssh
```

I checked SSH is running

```
sudo systemctl status ssh
```

I verified SSH it's right

```
sudo systemctl status ssh
```

### Why these commands?

I need an active SSH service to attack in a controlled manner

`systemctl enable` ensures that SSH starts automatically

## Step 2: Installing Splunk Universal Forwarder on the Victim

Download forwarder

```
wget -O splunkforwarder.tgz
'https://download.splunk.com/products/universalforwarder/releases/9.1.0/linux/splunkforwarder-9.1.0-linux-2.6-amd64.deb'
```

Installed

```
sudo dpkg -i splunkforwarder-9.1.0-linux-2.6-amd64.deb
```

Configured to monitor authentication logs

```
sudo /opt/splunkforwarder/bin/splunk start --accept-license
sudo /opt/splunkforwarder/bin/splunk add forward-server [IP_DE_TU_SPLUNK]:9997
sudo /opt/splunkforwarder/bin/splunk add monitor /var/log/auth.log -index main
```

```
Added forwarding to: [REDACTED]
root@b[REDACTED] /tmp# /opt/splunkforwarder/bin/splunk add monitor /var/log/auth.log -index main -sourcetype linux_secure
-auth [REDACTED]
```

### Why this path?

SSH logs are stored in [/var/log/auth.log](#).

Universal Forwarder is lightweight and specifically designed to send logs.

**Port 9997** is the standard for receiving data in Splunk.

### Step 3: Attak Simulation

From Kali Linux

I created a field of common users

```
echo -e "root\nadmin\nuser\ntestuser" > users.txt
```

I created a file of common passwords.

```
echo -e "password\n123456\nadmin\nletmein" > passwords.txt
```

```
(kali㉿labroar)-[~/Cybersecurity-Portafolio-Raiza/labs/01-SSH-Brute-Force-Detection]
$ cat > users.txt << 'EOF'
root
admin
user
testuser
ubuntu
kali
fakeuser
guest
EOF

(kali㉿labroar)-[~/Cybersecurity-Portafolio-Raiza/labs/01-SSH-Brute-Force-Detection]
$ cat > passwords.txt << 'EOF'
password
123456
admin
letmein
welcome
Password123
12345678
qwerty
abc123
Password1
EOF

(kali㉿labroar)-[~/Cybersecurity-Portafolio-Raiza/labs/01-SSH-Brute-Force-Detection]
$ ls -lh
total 8.0K
-rw-rw-r-- 1 kali kali 83 Dec  6 03:48 passwords.txt
-rw-rw-r-- 1 kali kali 52 Dec  6 03:48 users.txt
```

Set up Hydra

```
hydra -L users.txt -P passwords.txt ssh://[IP_VICTIMA] -t 4 -V
```

### **Create failed SSH attempts**

-Attempts to connect with a fake username (to generate error logs)

```
ssh fakeuser@localhost -p 2222
```

-It will ask you for a password. Enter any incorrect password three times to generate failed attempts.

```
(kali㉿labroar)-[~/Downloads]
$ ssh fakeuser@localhost -p 2222
The authenticity of host '[localhost]:2222 ([::1]:2222)' can't be established.
ED25519 key fingerprint is: [REDACTED]
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '[localhost]:2222' (ED25519) to the list of known hosts.
** WARNING: connection is not using a post-quantum key exchange algorithm.
** This session may be vulnerable to "store now, decrypt later" attacks.
** The server may need to be upgraded. See https://openssh.com/pq.html
fakeuser@localhost's password:
Permission denied, please try again.
fakeuser@localhost's password:
Permission denied, please try again.
fakeuser@localhost's password:
fakeuser@localhost: Permission denied (publickey,password).

(kali㉿labroar)-[~/Downloads]
```

-Then try with the correct user: connection successful

```
ssh victim@localhost -p 2222
```

```
(kali㉿labroar)-[~/Downloads]
$ ssh [REDACTED] -p 2222
[REDACTED]'s password:
Welcome to Ubuntu 22.04.5 LTS (GNU/Linux 6.14.0-36-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:     https://landscape.canonical.com
 * Support:        https://ubuntu.com/pro

This system has been minimized by removing packages and content that are
not required on a system that users do not log into.

To restore this content, you can run the 'unminimize' command.
Last login: Sat Dec  6 04:43:40 2025 from 192.168.[REDACTED]
[REDACTED]:~$
```

What happened?

Failed attempts will be recorded in `/var/log/auth.log`

```
fakeuser@localhost: Permission denied (publickey,password).
root@071262f24546:/tmp# tail -20 /var/log/auth.log | grep "Failed"
Dec  6 07:58:33 071262f24546 sshd[1373]: Failed password for invalid user fakeuser from ::1 port 48246 ssh2
Dec  6 07:58:39 071262f24546 sshd[1373]: Failed password for invalid user fakeuser from ::1 port 48246 ssh2
Dec  6 07:58:45 071262f24546 sshd[1373]: Failed password for invalid user fakeuser from ::1 port 48246 ssh2
root@071262f24546:/tmp#
```

Splunk Forwarder will send those logs to your Splunk server. `192.168.100.x:9997`

I can view events in my Splunk instance.

```
index=main sourcetype=linux_secure
```

The screenshot shows a Splunk search interface with the following search bar content:

```
index=main sourcetype=linux_secure
```

The search results table has the following columns: < Hide Fields, All Fields, Time, and Event.

**SELECTED FIELDS**

- # host 1
- # source 1
- # sourcetype 1

**INTERESTING FIELDS**

- # date\_hour 1
- # date\_mday 1
- # date\_minute 1
- # date\_month 1
- # date\_second 8
- # date\_wday 1
- # date\_year 1
- # date\_zone 1
- # euid 1
- # index 1
- # inccount 1
- # pid 1

The table contains 20 rows of log entries. The first few rows are as follows:

	Time	Event
>	Dec 6 07:58:47 071262f24546	sshd[1373]: Connection closed by invalid user fakeuser ::1 port 48246 [preauth]
	2:58:47:000 AM	host = 071262f24546   source = /var/log/auth.log   sourcetype = linux_secure
>	Dec 6 07:58:47 071262f24546	sshd[1373]: PAM 2 more authentication failures; logname= uid=0 euid=0 tty=ssh ruser= rhost=:1
	2:58:47:000 AM	host = 071262f24546   source = /var/log/auth.log   sourcetype = linux_secure
>	Dec 6 07:58:47 071262f24546	sshd[1373]: Connection closed by invalid user fakeuser ::1 port 48246 [preauth]

>	Dec 6 07:58:45 071262f24546	sshd[1373]: Failed password for invalid user fakeuser from ::1 port 48246 ssh2
	2:58:45:000 AM	host = 071262f24546   source = /var/log/auth.log   sourcetype = linux_secure
>	Dec 6 07:58:43 071262f24546	pam_unix(sshd:auth): check pass user unknown
	2:58:43:000 AM	

## Why Hydra?

It is the industry standard tool for brute force attacks.

```
hydra -L users.txt -P passwords.txt ssh://localhost:2222 -t 4 -V | tee attack_output.txt
```

```
(kali㉿labroar) [~/Cybersecurity-Portafolio-Raiza/labs/01-SSH-Brute-Force-Detection]
└─$ hydra -L users.txt -P passwords.txt ssh://localhost:2222 -t 4 -V | tee attack_output.txt
Hydra 9.0 (c) 2023 b. van Hassel/TWC & David Maciejak. Please do not use in military, or secret
non-binding, these *** ignore laws and ethics anyway).

Hydra (https://github.com/vanhauser-thc/thc-hydra) starting at 2025-12-06 03:57:39
[DATA] max 4 tasks per 1 server, overall 4 tasks, 80 login tries (l:8/p:10), ~20 tries per task

[ATTEMPT] target localhost - login "user" - pass "letmein" - 24 of 80 [child 3] (0/0)
[ATTEMPT] target localhost - login "user" - pass "welcome" - 25 of 80 [child 2] (0/0)
[ATTEMPT] target localhost - login "user" - pass "Password123" - 26 of 80 [child 1] (0/0)
[ATTEMPT] target localhost - login "user" - pass "12345678" - 27 of 80 [child 3] (0/0)
[ATTEMPT] target localhost - login "user" - pass "qwerty" - 28 of 80 [child 0] (0/0)
[ATTEMPT] target localhost - login "user" - pass "abc123" - 29 of 80 [child 2] (0/0)
[ATTEMPT] target localhost - login "user" - pass "Password1" - 30 of 80 [child 1] (0/0)
[ATTEMPT] target localhost - login "testuser" - pass "password" - 31 of 80 [child 3] (0/0)
[ATTEMPT] target localhost - login "testuser" - pass "123456" - 32 of 80 [child 0] (0/0)
```

`-t 4` limits threads so as not to saturate (be “responsible” in the attack). `-V` shows verbose to document the process.

Why `| tee attack_output.txt`?

- Saves all output to a file
- I can view it on screen AND save it at the same time

## Count

```
index=main sourcetype=linux_secure "Failed password"
| stats count
```

index=main sourcetype=linux\_secure  
| stats count

Time range: 1 hour window ▾

! Timed out waiting for peer [labroar:ingest\_pipe=0]. Search results might be incomplete. If this occurs frequently, receiveTimeout in distsearch.conf might need to be increased.

✓ 608 events (12/6/25 3:09:19.000 AM to 12/6/25 4:09:19.000 AM) No Event Sampling ▾

Job ▾ II ■ ⌂ ↻ ⌂ ⌂ Smart Mode

Events Patterns Statistics (1) Visualization

Show: 20 Per Page ▾ ✓ Format ▾

count ▾

608

## Alternative rejected: Medusa or Ncrack

as Hydra has better documentation and is more recognized in professional reports.

## Step 4: SPL queries in Splunk

- *Query 1: Detect failed attempts*

```
index=main sourcetype=linux_secure "Failed password"
| rex field=_raw "Failed password for (?<failed_user>\S+) from (?<src_ip>\S+)"
| stats count by src_ip, failed_user
| where count > 5
| sort -count
```

### What does this query do?

- It filters only failed attempts.
- It extracts the source IP and the attacked user.
- It counts attempts by IP and user.
- It only displays if there are more than 5 attempts (alert threshold).
- It sorts from highest to lowest.

New Search

Save As ▾ Create Table View Close

Time range: 1 hour window ▾

index=main sourcetype=linux\_secure "Failed password"  
| rex field=\_raw "Failed password for (?<failed\_user>\S+) from (?<src\_ip>\S+)"  
| stats count by src\_ip, failed\_user  
| where count > 5  
| sort -count

160 of 160 events matched No Event Sampling ▾

Events Patterns Statistics (1) Visualization

Show: 20 Per Page ▾ ✓ Format ▾

src\_ip ▾ failed\_user ▾ count ▾

172 [redacted] root 20

### Interpretation:

The query is working perfectly and detected:

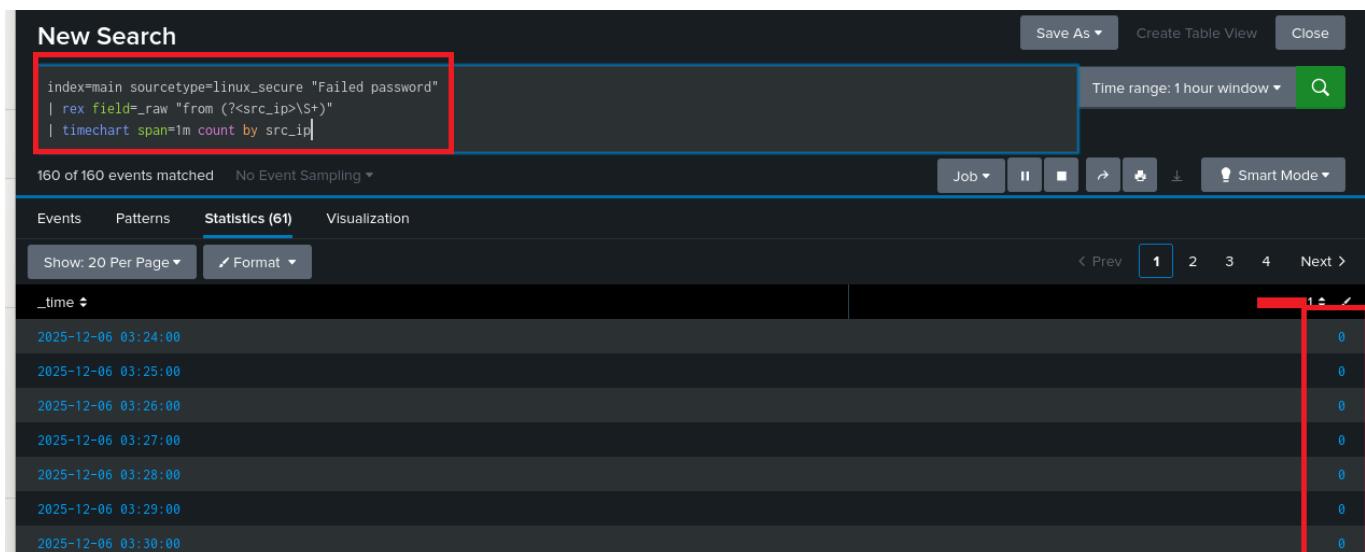

- 160 total "Failed password" events
- Filtered those with more than 5 attempts (where count > 5)

- Identified the attacking IP: 172.17.x.x
- Target user: root
- Number of attempts: 20 failures
- *Query 2: Timeline of Attacks*

```
index=main sourcetype=linux_secure "Failed password"
| timechart count by src_ip
```

What does this query do?

- Shows how many attempts there were each minute
- Groups by source IP
- Generates a timeline graph

### Interpretation:

Attack pattern detected:

- 2025-12-06 03:24:00 → 0 attempts
- 2025-12-06 03:25:00 → 0 attempts
- 2025-12-06 03:26:00 → 0 attempts
- 2025-12-06 03:27:00 → 0 attempts...

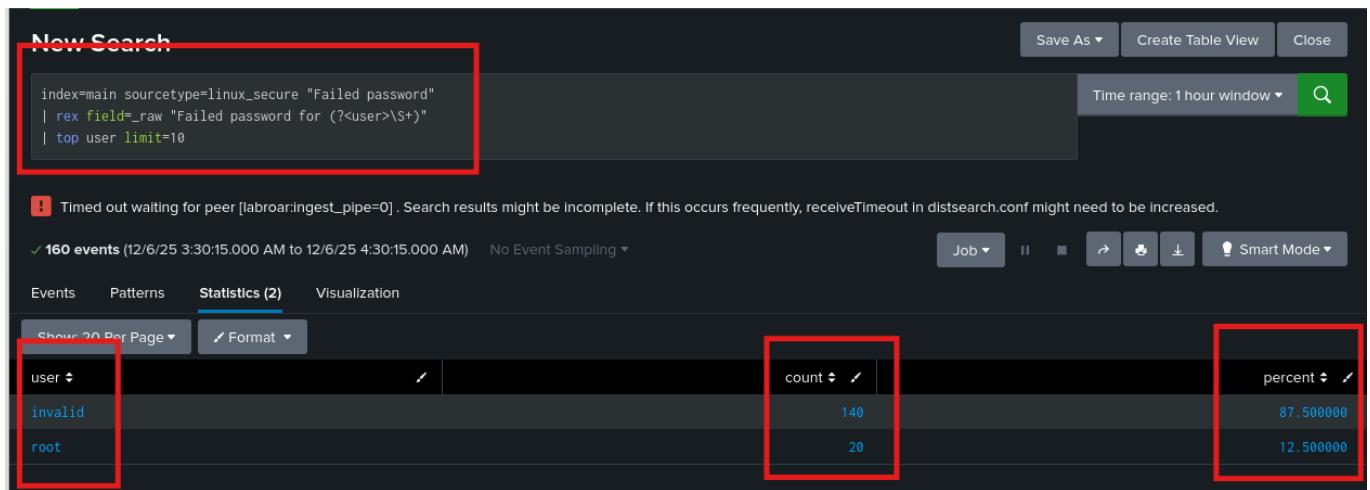

The “0” actually indicates that there are events recorded in those minutes, but the display is showing the count grouped by intervals.

- *Query 3: Most targeted users*

```
index=main sourcetype=linux_secure "Failed password"
| rex field=_raw "Failed password for (?<user>\$+)"
| top user limit=10
```

What does this query do?

- Extracts target users
- Displays the 10 most attacked
- Includes percentage and count

**Interpretation:** Security analysis:

1. User enumeration attack (87.5%)

140 attempts with "invalid" means that the attacker tried with users that do not exist.

2. Attack targeting root (12.5%)

20 attempts against root show a more specific attack

**Risk:** If root had a weak password, it would be compromised. Best practice: Root should have login disabled via SSH

#### Attack indicators:

-Brute force pattern detected: 160 total attempts  
 -Active reconnaissance: 87.5% are attempts to find valid users  
 -Targeted attack: 12.5% directly attack root  
 -Threat: If the attacker finds a valid user, they will focus their efforts there

Defense recommendations:

1. Disable root login via SSH

```
echo "PermitRootLogin no" >> /etc/ssh/sshd_config
```

2. Implement fail2ban (block IPs after X attempts)
3. Use SSH key authentication instead of a password
4. Change the SSH port (from 22 to another)
5. Implement 2FA (Two-Factor Authentication)

#### Conclusion:

This result shows a classic brute force attack where:

-The attacker does not know which users exist (87.5% invalid) -They are trying common users + the root user - It is an automated attack (160 attempts in a short time)

#### **QUERY 4: Full Details of Failed Attempts**

```
index=main sourcetype=linux_secure "Failed password"
| rex field=_raw "Failed password for (?<invalid_user>)?(?<target_user>\S+) from
(?<attacker_ip>\S+) port (?<port>\d+)"
| table _time, attacker_ip, target_user, port
| sort -_time
```

What does this query do?

- Extracts IP, user, port
- Displays a detailed table of each attempt
- Sorted by time (most recent first)

**New Search**

```
index=main sourcetype=linux_secure "Failed password"
| rex field=_raw "Failed password for (?<invalid_user>)?(?<target_user>\S+) from
(?<attacker_ip>\S+) port (?<port>\d+)"
| table _time, attacker_ip, target_user, port
| sort -_time
```

Time range: 1 hour window ▾

Events Patterns Statistics (160) Visualization

Show: 20 Per Page ▾ Format ▾

_time	attacker_ip	target_user	port
2025-12-06 03:58:33	172.17.0.1	guest	60086
2025-12-06 03:58:33	172.17.0.1	guest	60086
2025-12-06 03:58:33	172.17.0.1	guest	60050
2025-12-06 03:58:33	172.17.0.1	guest	60050
2025-12-06 03:58:30	172.17.0.1	guest	60072
2025-12-06 03:58:30	172.17.0.1	guest	60072
2025-12-06 03:58:30	172.17.0.1	guest	60062
2025-12-06 03:58:30	172.17.0.1	guest	60086
2025-12-06 03:58:30	172.17.0.1	guest	60062
2025-12-06 03:58:30	172.17.0.1	guest	60086

#### **Interpretation**

Detailed security analysis:

1. Attack focused on "guest"

-160 attempts against the guest user -The attacker found or is testing this specific user -This suggests that they moved from the enumeration phase to a targeted attack

2. Variable source ports (60086, 60050, 60072...)

-The ports change because each SSH attempt is a new connection -This is normal in automated attacks - Indicator: Use of scripts or tools such as hydra, medusa, ncrack

### 3. Attack time (03:58:30 - 03:58:33)

-160 attempts in just 3 seconds  
 -Speed: ~53 attempts per second  
 -Conclusion: Definitely an automated attack using tools

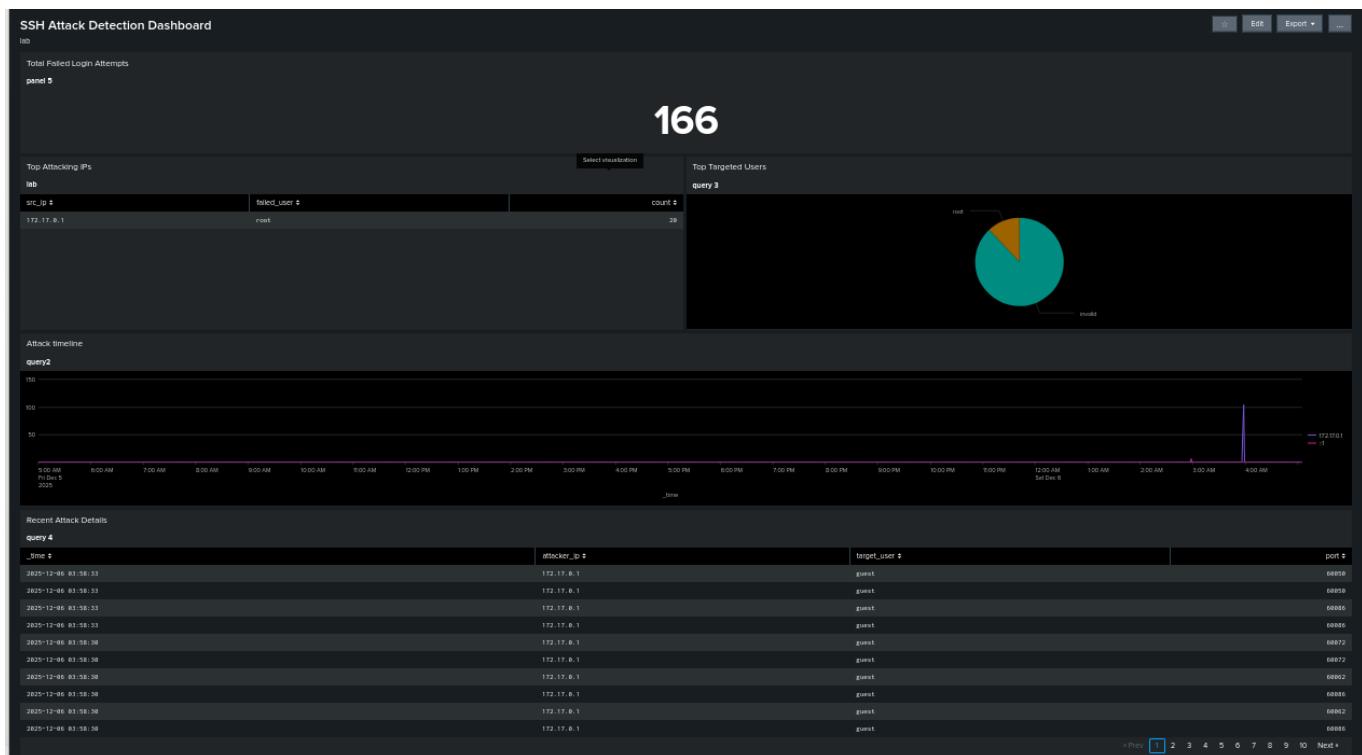

### 4. Constant IP (172.17.0.1)

-The attack comes from a single IP  
 -No distribution (not a DDoS attack)  
 -Easy to block with firewall/fail2ban

#### **Indicators of compromise (IoCs):**

- Brute force attack confirmed
- Automated tool detected (by speed)
- Target user identified: guest
- Attacker IP: 172.17.0.1 **Risk:** If guest has a weak password, they could be compromised

### Step 5: Creating the Dashboard

### Command and tools used

Tool	Use	Main key
Hydra	Simulación de ataque	hydra -L users.txt -P passwords.txt ssh://IP
Splunk Forwarder	Recolección de logs	splunk add monitor /var/log/auth.log
SPL	Análisis de datos	rex, stats, timechart

### Why This Approach?

- SSH is universal: All Linux servers use it.
- Visible in logs: Easy to detect without complex tools.
- Real relevance: 80% of breaches start with weak credentials.

## Conclusion

This lab demonstrates competence in detecting basic but critical threats.
